Overview

The use of 3-D laser scanning in design, construction, accident investigation, surveying and mapping and other applications has increased, but questions of whether and how to adopt this new technology cost-effectively remain. This seminar will help you understand the capabilities of land-based static and mobile scanning and airborne LiDAR. Practitioners will present lessons-learned in data collection and data processing, scanning applications, productivity and personnel training issues. A panel will discuss implementation decision-making in a Q & A session. This seminar will inform architects, engineers, contractors, owners, public safety officials and others how laser scanning could benefit their organization.
